Copper(II) oxide and carbon are both black solids. Copper(II) oxide reacts with dilute sulfacted to form aqueous copper(II) sulfate. Carbon does not react with dilute sulfuric acid. You are given a mixture of copper(II) oxide and carbon and access to dilute sulfuric acid. Plan an experiment to investigate the percentage of copper(II) oxide in the mixture.	d.

A student investigated the reaction of air with copper. 100 cm³ of air was passed continuously over heated copper using the apparatus below. When the volume remained constant, the apparatus was left to cool and the volume of gas was measured.

(a)	(i)	Complete the box to show the apparatus labelled.	[1]
	(ii)	Indicate on the diagram, with an arrow, where heat is applied.	[1]
(b)	Wh	at should be used to transfer the copper from a bottle to the apparatus?	
			[1]
(c)	The	copper changed colour from brown to	[1]
(d)	Wh	y was the apparatus left to cool before measuring the final volume of gas?

A student investigated the reaction between aqueous copper(II) sulfate and two different metals, zinc and iron.

Two experiments were carried out.

Experiment 1

Using a measuring cylinder, 25 cm³ of aqueous copper(II) sulfate was poured into a polystyrene cup. The temperature of the solution was measured. The timer was started and the temperature was measured every half a minute for one minute.

At 1 minute, 5 g of zinc powder was added to the cup and the mixture stirred with the thermometer. The temperature of the mixture was measured every half minute for an additional three minutes.

(a) Use the thermometer diagrams in the table to record the temperatures.

time/min	thermometer diagrams	temperature/°C
0.0	25	·
0.5	25 -20 -15	
1.0	25 -20 -15

Experiment 2

Experiment 1 was repeated using 5 g of iron powder instead of the zinc powder.

(b) Use the thermometer diagrams in the table to record the temperatures.
